# Product Configurator

The Product Configurator allows Order Entry to construct products using pre-defined features and option. This significantly reduces the quantity of items in the database, and makes for easier and more efficient order entry.

FUNCTIONALITIES

- Presents the user with a facility to enter, define, and maintain end-item configurations.

- Reduces item, bill of material, and routing database space requirements.

- Simplifies the defining of complex configurations for end items.

- Includes a replacement feature allowing the replacement of place-holder items with pre-defined features.

- Maintains item details, material requirements, and routings in quotes.

- Allows for user-defined interdependencies of features and options.

- Saves time by eliminating the need for Engineering to create custom product structures for each order line item.

- Features a Product Family Configuration Report that presents family, feature and option information in various levels of detail.

- Displays a pick list of possible features and options when placing an order for a configured item.

- Presents an on-line display of features and options selected for a given order line item.

- Fully integrated with other PK modules.
